

Pneumonia Prevention Research until 2020

Healthy Adults:

 are invited to take part in research to prevent pneumonia

SNEAS Study: participants attend short visits 10 – 60 mins:

Are you a healthy adult over 18 years age (non-smoker)?

Adults develop natural immunity to a bacteria *Streptococcus pneumoniae*. In this study we will monitor how our natural immunity responds to bacteria that are often found in the nose when we are healthy. We then compare this to people who have the same bacteria with the genes that may cause illness removed. We would like to collect samples, for example squirting a little water in your nose, blood samples and throat swabs (like a cotton bud).

In future this research may help prevent pneumonia in vulnerable people (e.g. young children, asthmatics or elderly).
